Your next move starts here.

From past work to your next proof project

You already have a work history. Use this workbook to investigate what may transfer, compare two directions, and choose a small project that gives you something concrete to show.

The method
Actual tasks - transferable capabilities - two possible directions - one important gap - one proof project - a truthful career story.

Take a first pass in 20-30 minutes, then return with current role descriptions and project evidence. This is a starting session, not a promise of a completed career plan. Print the pages or annotate your own copy. No resume upload is needed.

Choose your starting question

- ☐ Adapt within my current kind of work.
- ☐ Investigate adjacent work.
- ☐ Consider a larger career change.
- ☐ Find near-term work while exploring a longer-term direction.
- ☐ Compare options because I am unsure.

Work I want to keep doing

Constraints that matter: available time, tools, location, schedule

Date I will review this plan

Start with actual tasks.

01 / Make your experience visible

Use "I did..." statements. Include an output and the judgment involved. Keep your historical title accurate. Mark evidence unavailable when you cannot share it; keep confidential files private.

Fictional example: "I reproduced gameplay defects and documented expected versus actual behavior." Possible capabilities: case design and clear defect reporting. Evidence status: self-reported history; old studio files unavailable. This suggests a connection to investigate, not verified AI experience.

Actual task	Output / decision	Possible capability	Evidence I may use
1.			
2.			
3.			
4.			
5.			

Cross out connections that overstate your work. Add a missing task. A blank or uncertain connection is allowed.

Compare two directions.

02 / Check the work behind the title

Use current employer descriptions. Save exact links and check dates. Compare responsibilities, prerequisites, interests, and constraints. Neither direction fitting is a valid result.

Question	Direction A	Direction B
Role or work direction		
Exact employer link + check date		
Three recurring tasks		
My relevant task evidence		
Capability still unassessed		
Important prerequisites		
Interests / constraints		
Question to answer next		

Fictional example: Rin compares software QA with product operations. QA appears closer to reported test-design work. Scripting remains unassessed. Product operations needs more evidence. No fit percentage or hiring probability is assigned.

My provisional choice and what could change my mind

Define one proof project.

03 / Test the connection with a small piece of work

Choose one task from your provisional direction. Keep it small enough to finish, inspect, and explain. Use synthetic or public material when you cannot use real data, and label it.

User, problem, and output

Input and tools I already have

Capability I will practice

What AI may assist with / what I will decide and check

Effort limit and a smaller scope if needed

Three observable completion checks

1. Normal case

2. Edge or missing-input case

3. Failure or recovery case

Keep some cases separate from the ones used to improve the work. A local checker using saved synthetic replies demonstrates checker mechanics; it does not measure live-model performance.

Keep evidence with each claim.

04 / Report what actually happened

Save permitted inputs, source files, run/open instructions, actual results, decisions, and limitations. A screenshot or generated case study helps explain the work; it does not replace the underlying evidence.

Claim	Artifact / source	Check + actual result	Review status / limit

Reported: my account of prior work.
Inferred: a connection I am investigating.
Demonstrated in this project: supported by the example under stated conditions.
Record who reviewed it and what they checked. Self-review is not independent certification. Missing results remain unassessed.

One failure I observed

What I changed or decided because of it

What remains unresolved

Tell a story you can defend.

05 / Connect your background to recent practice

Complete this draft using supported claims. Keep independent projects separate from employment history.

My background is in...

I have experience doing...

I am exploring... because it uses...

My recent independent project demonstrates...

Under these conditions...

I am still learning...

Project resume bullet: built/did + specific task + output/check + scope. Add a measured outcome only when you have the baseline and result.

Illustrative wording, only after comparable work is complete: "Built a local checker for synthetic support replies, with required-field and escalation checks, reproducible cases, and a documented failure report."

Do not rename a past job, invent AI employment, or imply production deployment from a local demonstration.

Make the next step concrete.

06 / A flexible seven-step sequence

This is a suggested sequence, not a promise of getting hired in a week. Keep a near-term job search alongside learning when needed.

Step	Action	Evidence of progress
1	Complete the task inventory	Five tasks and corrected connections
2	Inspect two directions	Current employer links and requirements
3	Choose a question to test	Project brief and completion checks
4	Build a small first version	Inspectable files or outputs
5	Check it and record a failure	Actual results and a revision decision
6	Write a short case study	Problem, contribution, evidence, limits
7	Prepare one resume or conversation	Accurate claims and a next question

My next action

When I will do it

At your review date: continue, narrow the project, investigate the alternative, or seek help with a specific gap.

Keep learning from the work

Start an AI learning assessment or explore the learning library. No account is needed to start the assessment.

This workbook supports your planning. It does not verify employment history, certify capability, or promise a hiring outcome. Correct the map as you learn.
